

Precision Measurements, Small Cross-sections, and Non-Standard Signatures: The Learning Curve at a Hadron Collider (τ_L)

Henry Frisch
University of Chicago

Some topics for thought and discussion
among experimentalists and theorists

Some aspects are pedagogical- apologies to experts in advance

Some topics woven in the talk: (part of the hadron collider culture)

1. 'Objects' and their limitations (e.g. em clusters)
2. Fake rates and efficiencies ($z=1$ limit and I-spin)
3. The rationale for signature-based searches
4. The problem of communicating experimental results in a model-independent way
5. The problem of Njets
6. Systematics-limiting variables
7. W and Z as imbedded luminosity 'markers'
8. Muon brems and EM energy (if time...)
9. The role of hardware in educating and attracting grad students
10. The doubling time: luminosity vs learning

Acknowledgements

- Thanks to many CDF and D0 colleagues whose work I'll show... Also SM MC generator folks!
- Apologies to D0- I tend to show much more CDF than D0 as I know it much better
- Opinions and some of the plots are my own, and do not represent any official anything.

Where is the Higgs? M_{top} vs M_W

M_{top} vs M_W Status as of Summer 2006 (update below)
 Central value prefers a light (too light) Higgs

Puts a High Premium on Measuring M_{top} and M_W precisely, no matter what happens at the LHC (really diff. systematics at Tevatron.)

'Understanding Objects' and their limitations

Example- electro-magnetic (em) cluster

Identify an em cluster as one of 3 objects: (CDF)

$E/p < 2$: Electron

$E/p > 2$: Jet

$P < 1$: Photon

Where p is from track, E is from cal

E/p measures

bremstrahlung fraction Recent 'typical' zoo event (only an example)

New (Jan. 5, 07) CDF W Mass

Data from Feb. 02-Sept 03
218 pb⁻¹ for e; 191 pb⁻¹ for μ

A Systematics Intensive Measurement..
This is a precision spectrometer!

First, Calibrate the spectrometer momentum scale on the J/Psi and Upsilon-material traversed by muons really matters in electron W mass measurement.

Note: This is a **small** fraction of data taken to date- this is to establish the calibrations and techniques (so far) for Run II.

New (Jan. 5, 07) CDF W Mass

Run Ib Problem Now Solved: 2 Calibrations of EM calorimeter:
Zmass \neq E(cal)/p(track)

Electron and Muon Transverse Mass Fits

1. Electrons radiate in material near beam-pipe, but cal (E) gets both e and g; spectrometer sees only the momentum (not the g):
2. Use peak of E(cal)/p(spectrometer) to set EM calorimeter scale
3. Use tail of E/p to calibrate the amount of material
4. Check with mass of the Z. Run I didn't work well (Ia, Ib). Now understood (these were 2 of the dragons).

Princeton 3/21/07

New (Jan. 5, 07) CDF W Mass

See William Trischuk's talk for details, explanations

Transverse Mass Fit Uncertainties (MeV)

	<i>electrons</i>	<i>muons</i>	<i>common</i>
W statistics	48	54	0
Lepton energy scale	30	17	17
Lepton resolution	9	3	-3
Recoil energy scale	9	9	9
Recoil energy resolution	7	7	7
Selection bias	3	1	0
Lepton removal	8	5	5
Backgrounds	8	9	0
pT(W) model (g2,g3)	3	3	3
Parton dist. Functions	11	11	11
QED rad. Corrections	11	12	11
Total systematic	39	27	26
Total	62	60	

Systematic uncertainties shown in green: statistics-limited by control data samples

**Note: This is with only 0.2 fb⁻¹
and 1 experiment: have ~2 fb⁻¹...**

	<i>W mass (MeV)</i>
DELPHI	80336 ± 67
L3	80270 ± 55
OPAL	80416 ± 53
ALEPH	80440 ± 51
CDF-I	80433 ± 79
D0-I	80483 ± 84
LEP Average	80376 ± 33
Tevatron-I Average	80454 ± 59
Previous World Average	80392 ± 29
CDF-II (preliminary)	80413 ± 48
New Tevatron Average	80429 ± 39
New World Average	80398 ± 25

CDF Wmass group believes each systematic in green scales like a statistical uncertainty =>

We will enter another round of learning at 600-1000 pb (typically a 3 year cycle or so)

N.B. 48 MeV/80 GeV

The Learning Curve at a Hadron Collider (τ_L)

Take a systematics-dominated measurement: e.g. the W mass.

Dec 1994 (12 yrs ago)-

'Here Be Dragons' Slide: remarkable how precise one can do at the Tevatron (MW, Mtop, Bs mixing, ...)- but has taken a long time-like any other precision measurements requires a learning process of techniques, details, detector upgrades....

Theorists too(SM)

Tevatron experience indicates:

It will not be luminosity-doubling time but systematics-halving time that determines when one will know that one no longer needs the Tevatron. We should NOT shut off the Tevatron until we have relatively mature physics results from the LHC (i.e. it's clear that we won't need the different systematics.)

Have lots of hadron-collider experience now-

1. remarkable precision in energy scales possible (e.g. MW to better than part per mil)
2. remarkable precision in real-time reconstruction and triggering (e.g. SVT triggering on B's at CDF);
3. remarkably long and hard development of tools (e.g. jet resolution, fake rates, tau id, charm, strange id).

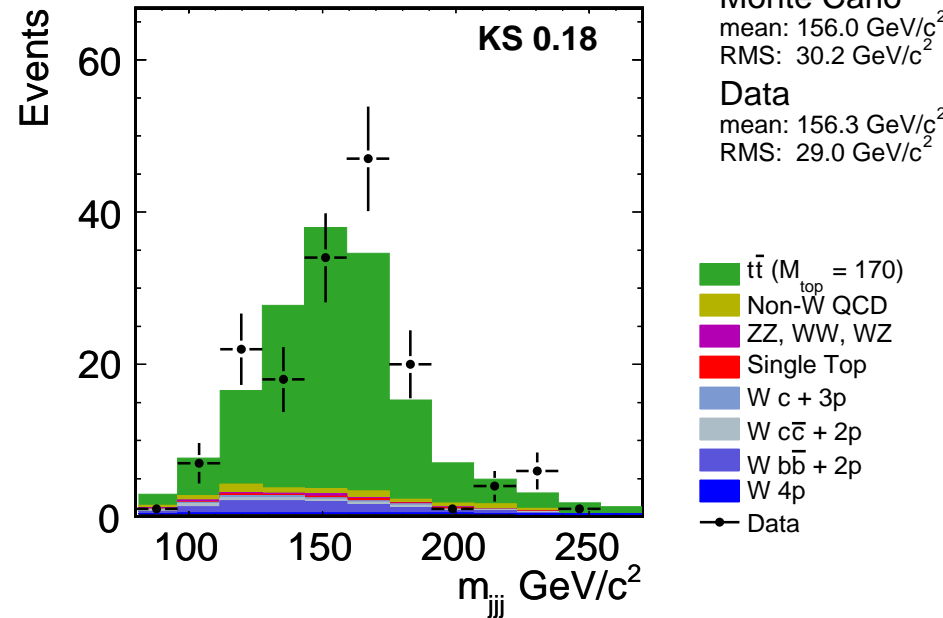

Precision Measurement of the Top Mass

CDF Run II Preliminary (940 pb⁻¹)

$M(2\text{-jets})$ - should be M_W

CDF Run II Preliminary (940 pb⁻¹)

$M(3\text{-jets})$ - should be M_{top}

CDF e/μ-Met+4 Jets (1b) - 0.94 fb⁻¹, ~170 ttbar events

A real CDF Top Quark Event

T-Tbar -> W⁺bW⁻bbar

Can we follow the color flow through kaons, charm, bottom? **TOF!**

Precision Measurement* of the Top Mass

*like Mrenna

CDF Lepton+4jets: Systematics:

Jet Energy Scale (JES)
Now set by MW (jj)

Note FSR, ISR,
JES, and b/j JES
dominate- all
measurable with
more data, at
some level...

Systematic uncertainties (GeV/c ²)		
JES residual	0.42	4
Initial state radiation	0.72	2
Final state radiation	0.76	1
Generator	0.19	
Background composition and modeling	0.21	
Parton distribution functions	0.12	
b-JES	0.60	3
b-tagging	0.31	
Monte Carlo statistics	0.04	
Lepton p _T	0.22	
Multiple Interactions	0.05	
Total	1.36	

Again- systematics go down with statistics- no 'wall' (yet) ₄₃

The Importance of the $M_W - M_{\text{Top}} - M_{\text{Higgs}}$ Triangle

- Much as the case for Babar was made on the closing of the CKM matrix, one can make the case that closing the $M_W - M_{\text{Top}} - M_{\text{Higgs}}$ triangle is an essential test of the SM.
- All 3 should be measured at the LHC- suppose the current central values hold up, and the triangle doesn't close (or no H found!). Most likely explanation is that precision M_W or M_{Top} is wrong. Or, $H \rightarrow 4\tau$ or worse, or, ...? (low Et, met sigs)
- The systematics at the Tevatron are completely different from those at the LHC- much less material, known detectors, $q\bar{q}$ instead of gg , # of interactions, quieter events (for M_W).
- \Rightarrow Prudent thing to do is don't shut off until we see $M_W - M_{\text{Top}} - M_{\text{Higgs}}$ works.

MW-Mtop Plane with new CDF #'s

$M_W = 80.398 \pm 0.025 \text{ GeV}$ (inc. new CDF 200pb^{-1})

$M_{\text{Top}} = 171.4 \pm 2.1 \text{ GeV}$ (ICHEP 06)

$\Rightarrow M_H = 80 + 36 - 26 \text{ GeV}; M_H < 153 \text{ GeV}$ (95% C.L.)

$M_H < 189 \text{ GeV}$ w. LEPII limit (M. Grunewald, Pvt.Comm.)

Precision Measurement of the Top Mass

Aspen Conference Annual Values (Doug Glenzinski Summary Talk)

Jan-05: $\Delta M_t = \pm 4.3$ GeV

Jan-06: $\Delta M_t = \pm 2.9$ GeV

Jan-07: $\Delta M_t = \pm 2.1$ GeV

Note we are doing almost 1/root-L even now

Setting JES with MW puts us significantly ahead of the projection based on Run I in the Technical Design Report (TDR). Systematics are measurable with more data (at some level- but W and Z are bright standard candles.)

Aside- One old feature may be going away-top mass in dileptons was too low...

$$M_{\text{top}}(\text{All Jets}) = 173.4 \pm 4.3 \text{ GeV}/c^2$$

$$M_{\text{top}}(\text{Dilepton}) = 167.0 \pm 4.3 \text{ GeV}/c^2$$

$$M_{\text{top}}(\text{Lepton+Jets}) = 171.3 \pm 2.2 \text{ GeV}/c^2$$

(Rainer Wallny, Aspen 07)

Dilepton a little low, but statistically not significant- also D0 number not low now...

Comparison of M_{top} in Different Final States
(Tevatron Preliminary, July 2006)

Direct Limits on SM Higgs

This is the factor one needs to get the 95% CL down to the SM Higgs Xscn

Direct Limits on SM Higgs-cont.

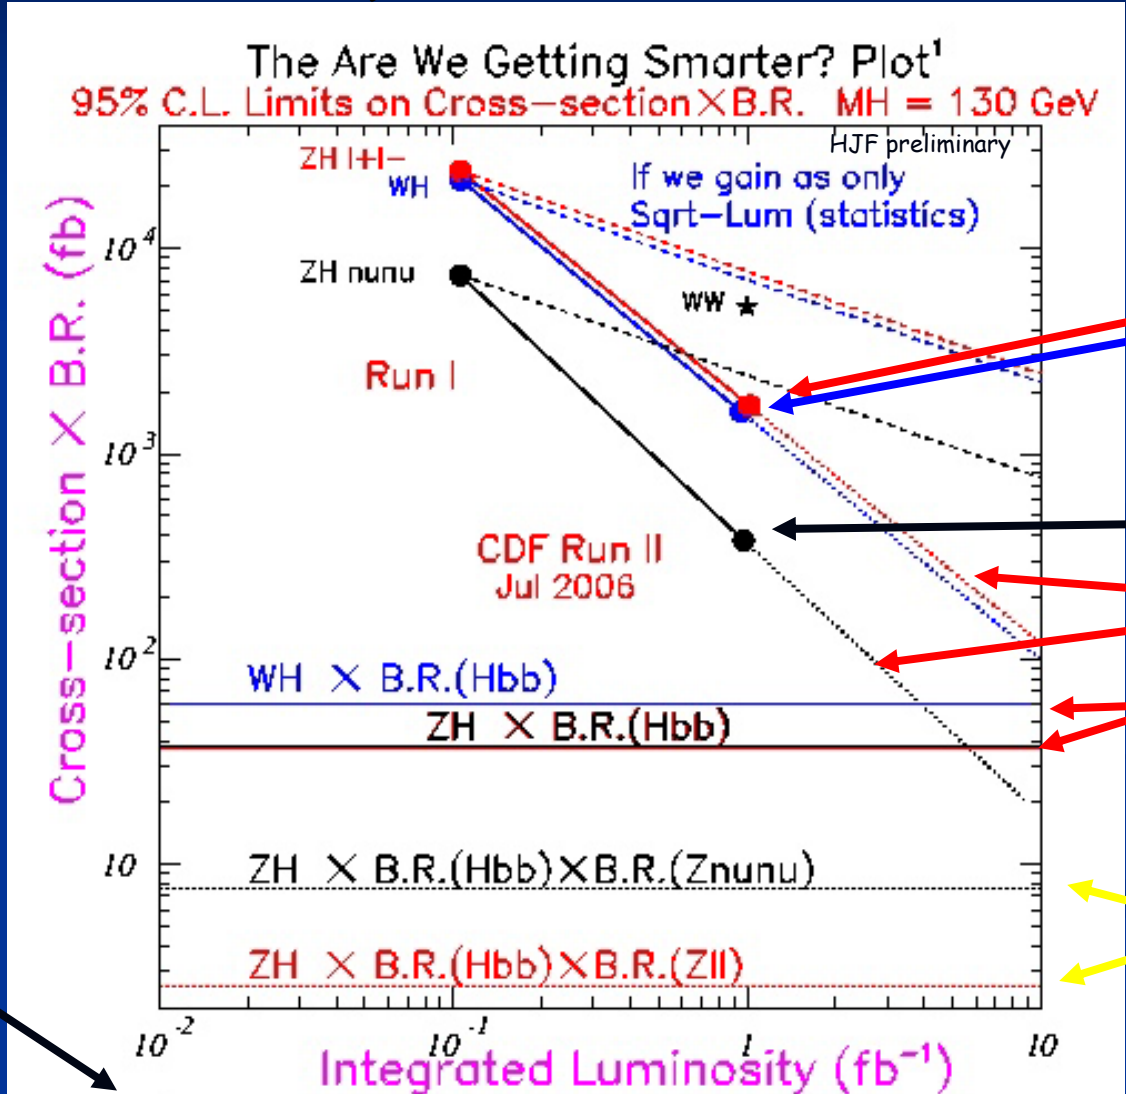

CDF has recently (1/31/07) updated high mass region

D0 has recently (3/12/07) updated low mass region

I'm not willing to prognosticate (other than to bet \$ we don't see the SM Higgs)- would rather postnosticate. However, lots of tools not yet used- we're learning many techniques, channels,...

Higgs Limits have gone faster than $1/\sqrt{L}$; faster than $1/L$, even

ZH, WH
 *BR(Hbb)

ZH $\nu\nu$

Not guaranteed!!

Xsctns to compare to

ev/fb produced

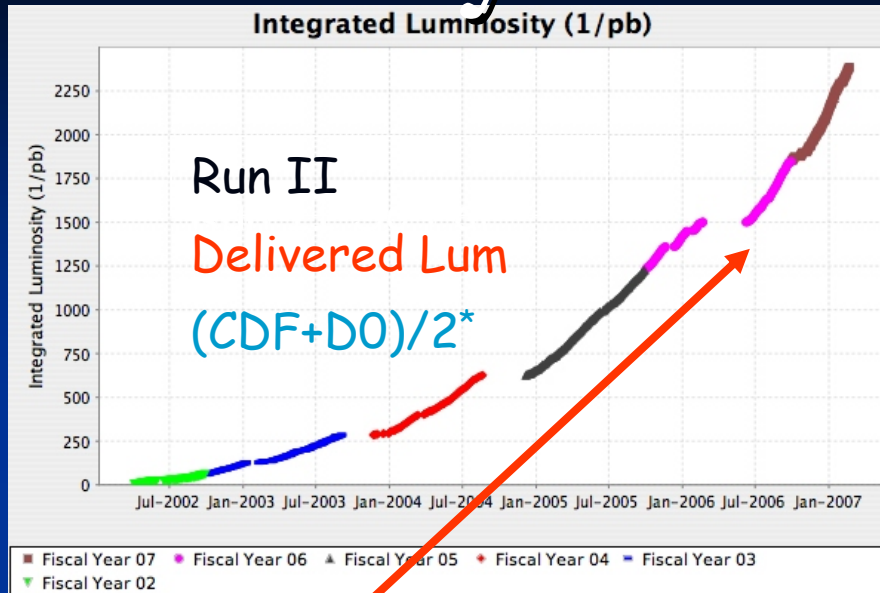

Comment from already smart Russian grad student on seeing plot

¹Sasha— maybe we didnt get enough before... (Smarter, that is)

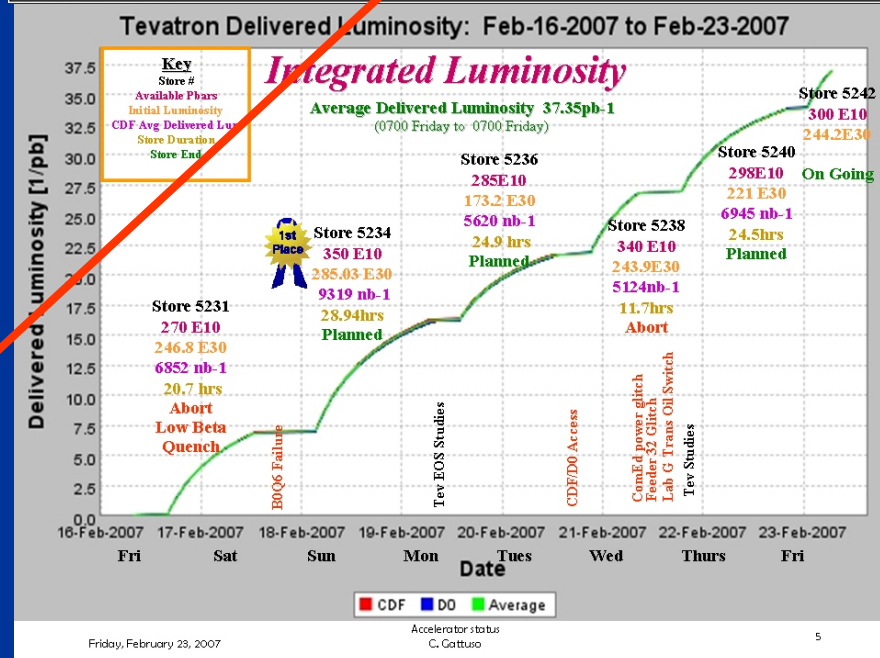

Luminosity vs Time

CDF

D0

Note pattern-integral grows when you don't stop, with increasing slope

*(Protons are smaller on this side (joke))

> 40 pb⁻¹/wk/expt 3/24/07 (40 wks/yr, e.g.)

Peak Lum coming up on 3E32

40-50 pb-1/wk times 40 weeks/yr = 2 fb-1/year delivered per expt-

There are more pbars even now. Peak lum problem => Luminosity leveling?

BUT: don't focus on big improvements- steady improving X running => smarts

Low-mass/low met SM, ..e.g. $eeggm$ Event Followup ($lg+X, gg+X$)

One event from CDF in Run I: 2 high-Pt electrons, 2 high-Pt photons, large missing E_t , and nothing else. Lovely clean signature- and very hard to do in the SM ($WW\gamma\gamma$).

Two Run I analyses looked for 'cousins' in 86 pb⁻¹ - spread a wide net: 2 photons+X (X=anything; Toback) and photon+lepton+X (Berryhill). In $g-l+X$ found a 2.7 σ excess over SM. From PRL:

`` CDF Run I PRL: ..an interesting result, but ... not a compelling observation of new physics. We look forward to more data...''

LHC has much more reach- but there may be regions of rel. soft things (e.g. met~20) that will not be top priority at CERN and where XYZ can hide

eeggmet Event Followup

Andrei Loginov repeated the lggmet analysis- same cuts (no optimization- kept it truly a priori. Good example of SM needs...

Run II: 929 pb⁻¹ at 1.96 TeV vs Run I: 86 pb⁻¹ at 1.8 TeV

CDF Run II Preliminary, 929pb ⁻¹			
Lepton+ Gamma + \cancel{E}_T Events

	170	100	11.5	1.27	0.85	0.68	0.65

TABLE XIX. The results of comparing the methods of calculating A_ϵ using the model-independent methods and the rigorously-derived A_ϵ . Each row is a variation of a model of supersymmetry as indicated by the label in the first column and the mass of a supersymmetric particle listed in column two (GeV). The column labeled A is the acceptance of the model in % and the next column is the rigorously-derived A_ϵ . The columns labeled with R are the ratios of the rigorously-derived A_ϵ to A_ϵ found using the model-independent method indicated.

Comparison of full MC with the 3 methods:

Conclusion - good enough for most applications, e.g. limits...

Case for gamma+b-quark+met+x (good technisig)²⁸

High Precision B-physics; Mixing, $B_s \rightarrow \mu\mu$

Note: 1 psec = 300 microns. SVT trigger is critical!!

Tevatron aspects complementary to LHC strengths to compare capabilities

- Obvious ones (pbar-p,..)
- Electron, photon, tau ID has much less material-ultimate M_W , $H \rightarrow \tau$ aus,?
- Tau-ID; photon/pizero separation (shower max)
- Triggering at $met \sim 20 \text{ GeV}$
- Triggering on b, c quarks (SVT)- also (?) hyperons,...

Fraction of a radiation length traversed by leptons from W decay (CDF Wmass analysis)- $\ll 1 X_0$

Tools needed at the Tevatron (20 yrs later)

Some topical typical examples:

- Jet fragmentation in the $Z=1$ limit for photon, tau fake rates (see a difference in u, d, c, b , gluon jets)

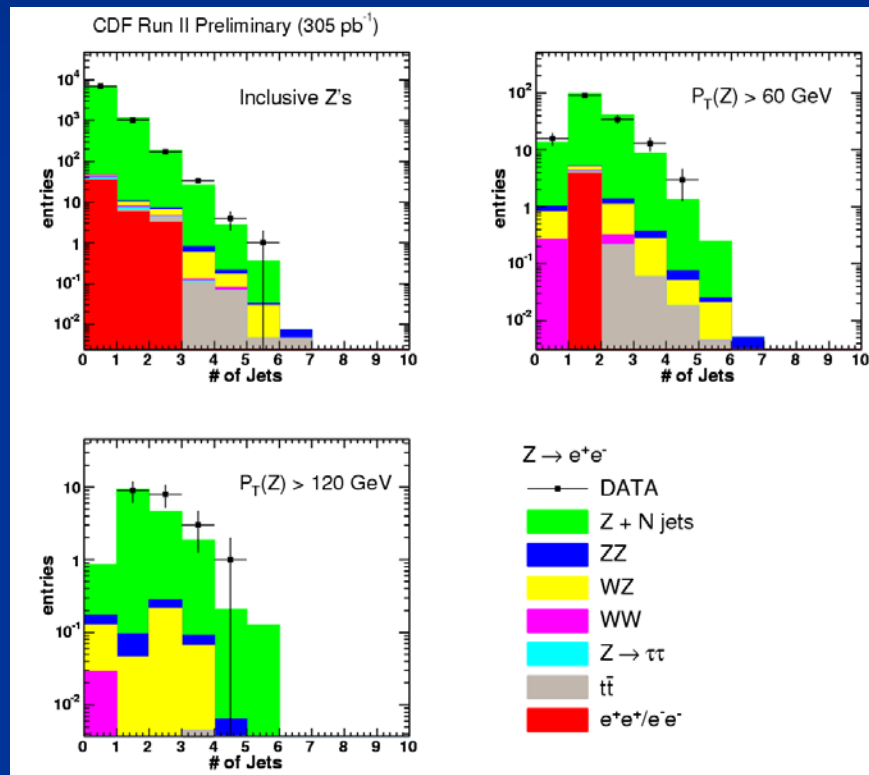

- $N_{\text{jets}} > 2, 3, 4, \dots$ for γ, W, Z

- $W, Z, \gamma + \text{Heavy Flavor}$ (e.g. $Zb, Zbj, Zb\bar{b}, Zbb\bar{b}rj, \dots$ -normalized event samples)

- Better, orthogonal, object ID

- Optimized jet resolution algorithms

- etc.... (tools get made when it becomes essential- 'mother of invention...')

HT for $P_T^Z > 0$, $P_T^Z > 60$, and $P_T^Z > 120$ GeV Z's: ee (Left) and $\mu\mu$ (right)

Problem of Njets ($W+N_j, Z+N_j$)

Cross section vs number of jets in W and Z events

% uncertainty vs number of jets in W and Z events

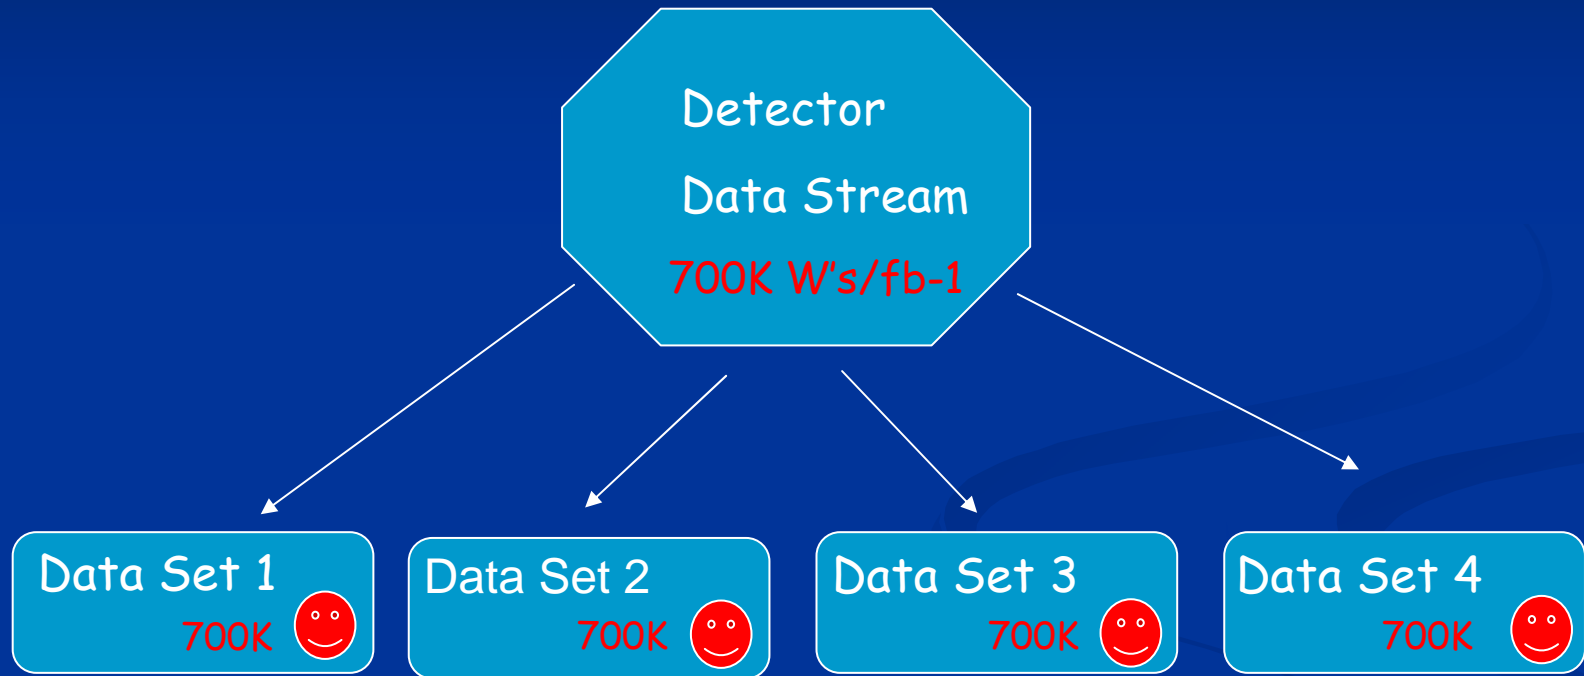

Event and W Properties	W/Z Ratio Method Reach		
	σ_W	$\sigma_{new} 2 fb^{-1}$	$\sigma_{new} 15 fb^{-1}$
0	1896 pb	20 pb (1.0%)	20 pb (1.0%)
1	370 pb	4.4 pb (1.2%)	3.7 pb (1.0%)
2	83 pb	1.5 pb (1.8%)	0.9 pb (1.1%)
3	15 pb	0.5 pb (3.5%)	240 fb (1.6%)
4	3.1 pb	230 fb (7.5%)	95 fb (2.9%)
5	650 fb	100 fb (16%)	40 fb (6%)
6	140 fb	50 fb (36%)	18 fb (13%)
7	28 fb	20 fb (78%)	8 fb (29%)
8	6 fb	—	4 fb (63%)

So, switch to a measurable that is more robust: look for new physics by precise measurements of $(W+N_jets)/(Z+N_jets)$

Systematics at few % level
(PRD68,033014;hep-ph/030388)

Tools: W and Z events as Imbedded Luminosity Markers

In measuring precise cross-sections much effort is spent on tiny effects in the numerator- the denominator is largely faith-based

Imbed a small record (e.g. 12 words per W or Z in every dataset. Counting W's and/or Z's will validate lum (cross-section!) to 1-2 % (not just normalizing- book-keeping...)

The attraction of hardware upgrades

Met calculated at L2 only- design dates back to 1984. Losing 30% of ZHnunu...Upgrade (now)!

- Find grad students love building hardware-e.g CDF Level-2 trigger hardware cluster finder upgrade:
- Trigger is a place a small gp can make a big difference
- E.g., Met at CDF

L2Cal Upgrade Group - new Cluster finder algorithm/hdwre

Figure 12: Expected signal shape as a function of corrected E_T of the SM Higgs assuming $M_H = 120$ GeV for the Higgs search in the $ZH \rightarrow \nu\nu b\bar{b}$ channel. The blue curve shows the efficiency of the trigger requiring MET and two jets currently used, and the red histogram shows the signal acceptance due to the trigger. Approximately 50% of the signal is lost after applying an offline cut to avoid systematic uncertainties in the trigger turn-on.

Figure 13: L1 MET trigger efficiency of (left) $E_T > 15$ GeV and (right) $E_T > 25$ GeV cuts for 8 (current), 9, and 10 bit precision of the MET calculation. L1 MET25 is currently used in the MET+2JET and inclusive MET triggers. The proposed upgrade will provide 10-bit precision at Level 2.

The attraction of hardware upgrades

(this is a little over the top- ignore it if you want to, please)

- Could even imagine bigger upgrades- e.g. may want to distinguish $W \rightarrow c\bar{s}b$ from $u\bar{d}b$, b from $b\bar{b}$ in top decays, identify jet parents, ..

- Outfit one of the 2 detectors with particle Id- e.g. TOF with $\sigma \leq 1$ psec:

Incoming particle makes light in window.

Collect signal here

Micro-channel Plate/Cherenkov Fast Timing Module

Generating the signal

Use Cherenkov light - fast

Incoming rel. particle

Custom Anode with Equal-Time Transmission Lines + Capacitive. Return

A 2" x 2" MCP-actual thickness ~3/4"

e.g. Burle (Photonis) 85022-with mods per our work

Collect charge here-differential

Princeton 3/21/07 Input to 200 GHz TDC chip

Major advances for TOF measurements:

Output at anode from simulation of 10 particles going through fused quartz window- T. Credo, R. Schroll

Jitter on leading edge 0.86 psec

Major advances for TOF measurements:

Most Recent work-

IBM 8HP
SiGe process
See talk by
Fukun Tang
(EFI-EDG)

3a. Oscillator with **predicted jitter ~5 femtosec (!)**
(basis for PLL for our 1-psec TDC) .
Princeton 3/21/07

Geometry for a Collider Detector

“r” is expensive- need a thin segmented detector

Summary

1. Tevatron running well - expect $\geq 1.5-2 \text{ fb}^{-1}/\text{yr/expt}$ of all goes well (could even be somewhat better- there are more pbars).
2. Experiments running pretty well and producing lots of hands-on and minds-on opportunities (lots of room for new ideas, analyses, and hardware upgrades (great for students!))
3. Doubling time for precision measurements isn't set by Lum- set by learning. Typical time constant \sim one grad student/postdoc.
4. Precision measurements- MW, Mtop, Bs Mixing, B states- MW and Mtop systematics statistics-limited
5. Can make a strong argument that pbar-p at 2 TeV is the best place to look for light SUSY, light Higgs,...; as met at EWK scale, (MW/2, Mtop/4) doesn't scale with mass, root-s, and tau's (maybe b's) are better due to lower mass in detector, and SVT and L1 tracking triggers,
6. All of which implies keep the Tevatron running until we know that we don't need it (and keep Fermilab strong for the ILC bid too!)

THE END

"You could be up to your belly-buttons in (SUSY) and not know it.."- C. Prescott⁴¹

BACKUP SLIDES

New CDF Higgs to taus result:

Tau ID depends on good tracking, photon ID- clean environment (all good at the Tevatron). Key numbers are efficiency and jet rejection:

This may be an area in which the Tevatron is better.

Recent Measurement in $\tau\text{-}\tau$ Channel- CDF

"The Excess is not Statistically Significant- We need more data...before we draw any conclusions"- CDF

Recent Measurement in $\tau\text{-}\tau$ Channel- D0

D0 has a dip at 160 in the same channel. (It pays to be patient and hang in there on the Higgs- a learning process...)

Backup- D0 btagging

Backup- lum on tape

A real CDF Top Quark Event

$T\text{-}\bar{T} \rightarrow W^+bW^-b\bar{b}$

Follow the color flow!

Luminosity vs Time

Note pattern-integral grows when you don't stop, with increasing slope

$> 40 \text{ pb}^{-1}/\text{wk}/\text{expt}$

*(Protons are smaller on this side (joke))
